

Dual-Channel, 16-Bit, 800 MSPS, Digital-to-Analog Converter (DAC)

Check for Samples: [DAC3283](#)

FEATURES

- Dual, 16-Bit, 800 MSPS DACs
- 8-Bit Input LVDS Data Bus
 - Byte-Wide Interleaved Data Load
 - 8 Sample Input FIFO
 - Optional Data Pattern Checker
- Multi-DAC Synchronization
- Selectable 2x-4x Interpolation Filters
 - Stop-Band Attenuation > 85 dB
- $F_s/2$ and $\pm F_s/4$ Coarse Mixer
- Digital Quadrature Modulator Correction
 - Gain, Phase and Offset Correction
- Temperature Sensor
- 3- or 4-Wire Serial Control Interface
- On-Chip 1.2-V Reference
- Differential Scalable Output: 2 to 20 mA
- Single-Carrier TM1 WCDMA ACLR: 82 dBc at $f_{OUT} = 122.88$ MHz
- Low Power: 1.3 W at 800 MSPS
- Space Saving Package: 48-pin 7x7mm QFN

APPLICATIONS

- Cellular Base Stations
- Diversity Transmit
- Wideband Communications
- Digital Synthesis

DESCRIPTION

The DAC3283 is a dual-channel 16-bit 800 MSPS digital-to-analog converter (DAC) with an 8-bit LVDS input data bus with on-chip termination, optional 2x-4x interpolation filters, digital IQ compensation and internal voltage reference. The DAC3283 offers superior linearity, noise and crosstalk performance.

Input data can be interpolated by 2x or 4x through on-chip interpolating FIR filters with over 85 dB of stop-band attenuation. Multiple DAC3283 devices can be fully synchronized.

The DAC3283 allows either a complex or real output. An optional coarse mixer in complex mode provides frequency upconversion and the dual DAC output produces a complex Hilbert Transform pair. The digital IQ compensation feature allows optimization of phase, gain and offset to maximize sideband rejection and minimize LO feed-through of an external quadrature modulator performing the final single sideband RF up-conversion.

The DAC3283 is characterized for operation over the entire industrial temperature range of -40°C to 85°C and is available in a 48-pin 7x7mm QFN package.

ORDERING INFORMATION

T_A	ORDER CODE	PACKAGE DRAWING/TYPE ^{(1) (2) (3)}	TRANSPORT MEDIA	QUANTITY
-40°C to 85°C	DAC3283IRGZT	RGZ/64QFN Quad Flatpack No-Lead	Tape and Reel	250
	DAC3283IRGZR			2000

(1) Thermal Pad Size: 5,6 mm × 5,6 mm

(2) MSL Peak Temperature: Level-3-260C-168 HR

(3) For the most current package and ordering information, see the Package Option Addendum at the end of this document, or see the TI website at www.ti.com.

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

PRODUCTION DATA information is current as of publication date. Products conform to specifications per the terms of the Texas Instruments standard warranty. Production processing does not necessarily include testing of all parameters.

Copyright © 2010–2012, Texas Instruments Incorporated

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

FUNCTIONAL BLOCK DIAGRAM

TERMINAL FUNCTIONS

TERMINAL		I/O	DESCRIPTION
NAME	NO.		
AVDD33	37, 40, 42, 45, 48	I	Analog supply voltage. (3.3 V)
ALARM_SDO	34	O	1.8V CMOS output for ALARM condition. The ALARM output functionality is defined through the CONFIG6 register. Default polarity is active low, but can be changed to active high via CONFIG0 alarm_pol control bit. Optionally, it can be used as the uni-directional data output in 4-pin serial interface mode (CONFIG 23 sif4_ena = '1').
BIASJ	43	O	Full-scale output current bias. For 20mA full-scale output current, connect a 960Ω resistor to GND.
CLKVDD18	1, 35	I	Internal clock buffer supply voltage. (1.8 V) It is recommended to isolate this supply from DACVDD18 and DIGVDD18.
D[7..0]P	9, 11, 13, 15, 21, 23, 25, 27	I	LVDS positive input data bits 0 through 7. Each positive/negative LVDS pair has an internal 100 Ω termination resistor. Data format relative to DATACLKP/N clock is Double Data Rate (DDR) with two data transfers per DATACLKP/N clock cycle. Dual channel 16-bit data is transferred byte-wide on this single 8-bit data bus using FRAMEP/N as a frame strobe indicator. D7P is most significant data bit (MSB) – pin 9 D0P is least significant data bit (LSB) – pin 27 The order of the bus can be reversed via CONFIG19 rev bit.
D[7..0]N	10, 12, 14, 16, 22, 24, 26, 28	I	LVDS negative input data bits 0 through 15. (See D[7:0]P description above) D7N is most significant data bit (MSB) – pin 10 D0N is least significant data bit (LSB) – pin 28
DACCLKP	3	I	Positive external LVPECL clock input for DAC core with a self-bias of approximately CLKVDD18/2.
DACCLKN	4	I	Complementary external LVPECL clock input for DAC core. (see the DACCLKP description)
DACVDD18	2, 36	I	DAC core supply voltage. (1.8 V) It is recommended to isolate this supply from CLKVDD18 and DIGVDD18.

TERMINAL FUNCTIONS (continued)

TERMINAL		I/O	DESCRIPTION
NAME	NO.		
DATACLKP	17	I	LVDS positive input data clock. This positive/negative pair has an internal 100 Ω termination resistor. Input data D[7:0]P/N is latched on both edges of DATACLKP/N (Double Data Rate) with two data transfers input per DATACLKP/N clock cycle.
DATACLKN	18	I	LVDS negative input data clock. (See DATACLKP description)
DIGVDD18	8, 29	I	Digital supply voltage. (1.8V) It is recommended to isolate this supply from CLKVDD18 and DACVDD18.
EXTIO	44	I/O	Used as external reference input when internal reference is disabled through CONFIG25 extref_ena = '1'. Used as internal reference output when CONFIG25 extref_ena = '0' (default). Requires a 0.1 μ F decoupling capacitor to AGND when used as reference output.
FRAMEP	19	I	LVDS frame indicator positive input. This positive/negative pair has an internal 100 Ω termination resistor. This signal is captured with the rising edge of DATACLKP/N and used to indicate the beginning of the frame. It is also used as a reset signal by the FIFO. The FRAMEP/N signal should be edge-aligned with D[7:0]P/N.
FRAMEN	20	I	LVDS frame indicator negative input. (See the FRAMEN description)
GND	5, Thermal Pad	I	Pin 5 and the Thermal Pad located on the bottom of the QFN package is ground for all supplies.
IOUTA1	38	O	A-Channel DAC current output. An offset binary data pattern of 0x0000 at the DAC input results in a full scale current sink and the least positive voltage on the IOUTA1 pin. Similarly, a 0xFFFF data input results in a 0 mA current sink and the most positive voltage on the IOUTA1 pin.
IOUTA2	39	O	A-Channel DAC complementary current output. The IOUTA2 has the opposite behavior of the IOUTA1 described above. An input data value of 0x0000 results in a 0 mA sink and the most positive voltage on the IOUTA2 pin.
IOUTB1	47	O	B-Channel DAC current output. Refer to IOUTA1 description above.
IOUTB2	46	O	B-Channel DAC complementary current output. Refer to IOUTA2 description above.
OSTRP	6	I	LVPECL output strobe positive input. This positive/negative pair is captured with the rising edge of DACCLKP/N. It is used to reset the clock dividers and for multiple DAC synchronization. If unused it can be left floating.
OSTRN	7	I	LVPECL output strobe negative input. (See the OSTRP description)
SCLK	32	I	1.8V CMOS serial interface clock. Internal pull-down.
SDENB	33	I	1.8V CMOS active low serial data enable, always an input to the DAC3283. Internal pull-up.
SDIO	31	I/O	1.8V CMOS serial interface data. Bi-directional in both 3-pin mode (default) and 4-pin mode. Internal pull-down.
TXENABLE	30	I	1.8V CMOS active high input. TXENABLE must be high for the DATA to the DAC to be enabled. When TXENABLE is low, the digital logic section is forced to all 0, and any input data is ignored. Internal pull-down.
VFUSE	41	I	Digital supply voltage. (1.8V) This supply pin is also used for factory fuse programming. Connect to DACVDD18 pins for normal operation.

ABSOLUTE MAXIMUM RATINGS

over operating free-air temperature range (unless otherwise noted) ⁽¹⁾

		VALUE	UNIT
Supply voltage range	DACDVDD18 ⁽²⁾	–0.5 to 2.3	V
	DIGVDD18 ⁽²⁾	–0.5 to 2.3	V
	CLKVDD18 ⁽²⁾	–0.5 to 2.3	V
	VFUSE ⁽²⁾	–0.5 to 2.3	V
	AVDD33 ⁽²⁾	–0.5 to 4	V
Terminal voltage range	CLKVDD18 to DIGDVDD18	–0.5 to 0.5	V
	DACVDD18 TO DIGVDD18	–0.5 to 0.5	V
	D[7..0]P ,D[7..0]N, DATACLKP, DATACLKN, FRAMEP, FRAME ⁽²⁾	–0.5 to DIGVDD18 + 0.5	V
	DACCLKP, DACCLKN, OSTRP, OSTRN ⁽²⁾	–0.5 to CLKVDD18 + 0.5	V
	ALARM_SDO, SDIO, SCLK, SDENB, TXENABLE ⁽²⁾	–0.5 to DIGCLKVDD18 + 0.5	V
	IOUTA1/B1, IOUTA2/B2 ⁽²⁾	–1.0 to AVDD33 + 0.5	V
	EXTIO, BIASJ ⁽²⁾	–0.5 to AVDD33 + 0.5	V
Peak input current (any input)		20	mA
Peak total input current (all inputs)		–30	mA
Operating free-air temperature range, T _A : DAC3283		–40 to 85	°C
Storage temperature range		–65 to 150	°C

(1) Stresses beyond those listed under *absolute maximum ratings* may cause permanent damage to the device. These are stress ratings only, and functional operation of these or any other conditions beyond those indicated under *recommended operating conditions* is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

(2) Measured with respect to GND.

THERMAL CHARACTERISTICS

over operating free-air temperature range (unless otherwise noted)

THERMAL CONDUCTIVITY		48ld QFN	UNIT
T _J	Maximum junction temperature ^{(1) (2)}	125	°C
θ _{JA}	Theta junction-to-ambient (still air)	30	°C/W
	Theta junction-to-ambient (150 lfm)	24	
θ _{JB}	Theta junction-to-board	8	°C/W
θ _{Jp}	Theta junction-to-pad	1.3	°C/W

(1) Air flow or heat sinking reduces θ_{JA} and may be required for sustained operation at 85° under maximum operating conditions.

(2) It is strongly recommended to solder the device thermal pad to the board ground plane.

ELECTRICAL CHARACTERISTICS — DC SPECIFICATIONS⁽¹⁾

over operating free-air temperature range, nominal supplies, IOUTFS = 20 mA (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN		TYP	MAX	UNIT

	DACVDD18, DIGVDD18, CLKVDD18		1.7	1.8	1.9		V
I _(AVDD33)	Analog supply current	Mode 1 (below)	149				mA
I _(DIGVDD)	Digital supply current		340				mA
I _(DACVDD18)	DAC supply current		55				mA
I _(CLKVDD18)	Clock supply current		37				mA
P	Power dissipation	Mode 1: f _{DAC} = 800MSPS, 4x interpolation, Fs/4 mixer on, QMC on	1300		1450		mW
		Mode 2: f _{DAC} = 491.52MSPS, 2x interpolation, Mixer off, QMC on	1000				mW
		Mode 3: Sleep mode f _{DAC} = 800MSPS, 4x interpolation, Fs/4 mixer on, CONFIG24 sleepa , sleepb set = 1	750				mW
		Mode 4: Power-Down mode No clock, static data pattern, CONFIG23 clkpath_sleep_a , clkpath_sleepb set = 1 CONFIG24 clkrecv_sleep , sleepa , sleepb set = 1	7		18		mW
PSRR	Power supply rejection ratio	DC tested	±0.2				%FSR/V
T	Operating range		−40	25	85		°C

(1) Measured differential across IOUTA1 and IOUTA2 with 25 Ω each to AVDD.

(2) The lower limit of the output compliance is determined by the CMOS process. Exceeding this limit may result in transistor breakdown, resulting in reduced reliability of the DAC3283 device. The upper limit of the output compliance is determined by the load resistors and full-scale output current. Exceeding the upper limit adversely affects distortion performance and integral nonlinearity.

(3) Use an external buffer amplifier with high impedance input to drive any external load.

FUNCTIONAL DESCRIPTION

DEFINITION OF SPECIFICATIONS

Adjacent Carrier Leakage Ratio (ACLR): Defined for a 3.84Mcps 3GPP W-CDMA input signal measured in a 3.84MHz bandwidth at a 5MHz offset from the carrier with a 12dB peak-to-average ratio.

Analog and Digital Power Supply Rejection Ratio (APSSR, DPSSR): Defined as the percentage error in the ratio of the delta IOUT and delta supply voltage normalized with respect to the ideal IOUT current.

Differential Nonlinearity (DNL): Defined as the variation in analog output associated with an ideal 1 LSB change in the digital input code.

Gain Drift: Defined as the maximum change in gain, in terms of ppm of full-scale range (FSR) per °C, from the value at ambient (25°C) to values over the full operating temperature range.

Gain Error: Defined as the percentage error (in FSR%) for the ratio between the measured full-scale output current and the ideal full-scale output current.

Integral Nonlinearity (INL): Defined as the maximum deviation of the actual analog output from the ideal output, determined by a straight line drawn from zero scale to full scale.

Intermodulation Distortion (IMD3, IMD): The two-tone IMD3 or four-tone IMD is defined as the ratio (in dBc) of the worst 3rd-order (or higher) intermodulation distortion product to either fundamental output tone.

Offset Drift: Defined as the maximum change in DC offset, in terms of ppm of full-scale range (FSR) per °C, from the value at ambient (25°C) to values over the full operating temperature range.

Offset Error: Defined as the percentage error (in FSR%) for the ratio between the measured mid-scale output current and the ideal mid-scale output current.

Output Compliance Range: Defined as the minimum and maximum allowable voltage at the output of the current-output DAC. Exceeding this limit may result reduced reliability of the device or adversely affecting distortion performance.

Reference Voltage Drift: Defined as the maximum change of the reference voltage in ppm per degree Celsius from value at ambient (25°C) to values over the full operating temperature range.

Spurious Free Dynamic Range (SFDR): Defined as the difference (in dBc) between the peak amplitude of the output signal and the peak spurious signal.

Noise Spectral Density (NSD): Noise Spectral Density (NSD): Defined as the difference of power (in dBc) between the output tone signal power and the noise floor of 1Hz bandwidth within the first Nyquist zone.

Register name: CONFIG0 – Address: 0x00, Default = 0x70

Register Name	Address	Bit	Name	Function	Default Value
CONFIG0	0x00	7	Reserved	Reserved for factory use.	0
		6	fifo_ena	When asserted the FIFO is enabled. When the FIFO is bypassed DACCCLKP/N and DATACLKP/N must be aligned to within t_align.	1
		5	fifo_reset_ena	Allows the FRAME input to reset the FIFO write pointer when asserted	1
		4	multi_sync_ena	Allows the FRAME or OSTR signal to reset the FIFO read pointer when asserted. This selection is determined by multi_sync_sel in register CONFIG19.	1
		3	alarm_out_ena	When asserted the ALARM_SDO pin becomes an output. The functionality of this pin is controlled by the CONFIG6 alarm_mask setting.	0
		2	alarm_pol	This bit changes the polarity of the ALARM signal. (0=negative logic, 1=positive logic)	0
		1:0	mixer_func(1:0)	Controls the function of the mixer block.	00
		Mode		mixer_func(1:0)	
		Normal		00	
High Pass (Fs/2)		01			
		Fs/4	10		
		−Fs/4	11		

Register name: CONFIG1 – Address: 0x01, Default = 0x11

Register Name	Address	Bit	Name	Function	Default Value
CONFIG1	0x01	7	qmc_offset_ena	When asserted the QMC offset correction circuitry is enabled.	0
		6	qmc_correct_ena	When asserted the QMC phase and gain correction circuitry is enabled.	0
		5	fir0_ena	When asserted FIR0 is activated enabling 2x interpolation.	0
		4	fir1_ena	When asserted FIR1 is activated enabling 4x interpolation. fir0_ena must be set to '1' for 4x interpolation.	1
		3	Unused	Reserved for factory use.	0
		2	iotest_ena	When asserted enables the data pattern checker operation.	0
		1	Unused	Reserved for factory use.	0
		0	twos	When asserted the inputs are expected to be in 2's complement format. When de-asserted the input format is expected to be offset-binary.	1

Register name: CONFIG2 – Address: 0x02, Default = 0x00

Register Name	Address	Bit	Name	Function	Default Value
CONFIG2	0x02	7	Unused	Reserved for factory use.	0
		6	Unused	Reserved for factory use.	0
		5	sif_sync	Serial interface created sync signal. Set to '1' to cause a sync and then clear to '0' to remove it.	0
		4	sif_sync_ena	When asserted this bit allows the SIF sync to be used. Normal FRAME signals are ignored.	0
		3	Unused	Reserved for factory use.	0
		2	Unused	Reserved for factory use.	0
		1:0	output_delay(1:0)	Delays the output to the DACs from 0 to 3 DAC clock cycles.	00

Register name: CONFIG3 – Address: 0x03, Default = 0x10

Register Name	Address	Bit	Name	Function	Default Value
CONFIG3	0x03	7	64cnt_ena	This enables resetting the alarms after 64 good samples with the goal of removing unnecessary errors. For instance, when checking setup/hold through the pattern checker test, there may initially be errors. Setting this bit removes the need for a SIF write to clear the alarm register.	0
		6	Unused	Reserved for factory use.	0
		5	Unused	Reserved for factory use.	0
		4:2	fifo_offset(2:0)	This is the default FIFO read pointer position after the FIFO read pointer has been synced. With this value the initial difference between write and read pointers can be controlled. This may be helpful in controlling the delay through the device.	100
		1	alarm_2away_ena	When asserted alarms from the FIFO that represent the write and read pointers being 2 away are enabled.	0
		0	alarm_1away_ena	When asserted alarms from the FIFO that represent the write and read pointers being 1 away are enabled.	0

Register name: CONFIG4 – Address: 0x04, Default = 0xFF

Register Name	Address	Bit	Name	Function	Default Value
CONFIG4	0x04	7:4	coarse_daca(3:0)	Scales the DACA output current in 16 equal steps. $\frac{V_{EXTIO}}{R_{bias}} \times (\text{coarse_daca}/b + 1)$	1111
		3:0	coarse_dacb(3:0)	Scales the DACB output current in 16 equal steps.	1111

		2:0	Reserved	Reserved for factory use.	000

Register name: CONFIG27 – Address: 0x1B, Default = 0x00 (CAUSES AUTOSYNC)

Register Name	Address	Bit	Name	Function	Default Value
CONFIG27	0x1B	7:0	qmc_gaina(7:0)	Lower 8 bits of the 11-bit DAC A QMC gain word. The upper 3 bits are located in the CONFIG30 register. The full 11-bit qmc_gaina(10:0) value is formatted as UNSIGNED with a range of 0 to 1.9990 and a default gain of 1. The implied decimal point for the multiplication is between bits 9 and 10. Writing this register causes an autosync to be generated. This loads the values of all four qmc_phase/gain registers (CONFIG27-CONFIG30) into the QMC block at the same time. When updating the QMC phase and/or gain values CONFIG27 should be written last. Programming any of the other three registers will not affect the QMC settings.	0X00

Register name: CONFIG28 – Address: 0x1C, Default = 0x00

Register Name	Address	Bit	Name	Function	Default Value
CONFIG28	0x1C	7:0	qmc_gainb(7:0)	Lower 8 bits of the 11-bit DAC B QMC gain word. The upper 3 bits are located in the CONFIG30 register. Refer to CONFIG27 for formatting.	0X00

Register name: CONFIG29 – Address: 0x1D, Default = 0x00

Register Name	Address	Bit	Name	Function	Default Value
CONFIG29	0x1D	7:0	qmc_phase(7:0)	Lower 8-bits of the 10-bit QMC phase word. The upper 2 bits are in the CONFIG30 register. The full 10-bit qmc_phase(9:0) word is formatted as two's complement and scaled to occupy a range of –0.125 to 0.12475 (note this value does not correspond to degrees) and a default phase correction of 0. To accomplish QMC phase correction, this value is multiplied by the current 'Q' sample, then summed into the 'I' sample.	0X00

Register name: CONFIG30 – Address: 0x1E, Default = 0x24

Register Name	Address	Bit	Name	Function	Default Value
CONFIG30	0x1E	7:6	qmc_phase(9:8)	Upper 2 bits of qmc_phase. Defaults to zero.	00
		5:3	qmc_gaina(10:8)	Upper 3 bits of qmc_gaina. Defaults to unity gain.	100
		2:0	qmc_gainb(10:8)	Upper 3 bits of qmc_gainb. Defaults to unity gain.	100

Register name: VERSION31 – Address: 0x1F, Default = 0x12 (PARTIAL READ ONLY)

Register Name	Address	Bit	Name	Function	Default Value
VERSION31	0x1F	7	clk_alarm	This bit is set to '1' when DATACLK is stopped for 4 clock cycles. Once set, the bit needs to be cleared by writing a '0'.	0
		6	tx_off	This bit is set to '1' when the clk_alarm is triggered. When set the DAC outputs are forced to mid-level. Once set, the bit needs to be cleared by writing a '0'.	0
		5:0	version(5:0)	A hardwired register that contains the version of the chip. (Read Only)	010010

SERIAL INTERFACE

The serial port of the DAC3283 is a flexible serial interface which communicates with industry standard microprocessors and microcontrollers. The interface provides read/write access to all registers used to define the operating modes of DAC3283. It is compatible with most synchronous transfer formats and can be configured as a 3 or 4 pin interface by **sif4_ena** in register **CONFIG23**. In both configurations, SCLK is the serial interface input clock and SDENB is serial interface enable. For 3 pin configuration, SDIO is a bidirectional pin for both data in and data out. For 4 pin configuration, SDIO is bidirectional and ALARM_SDO is data out only. Data is input into the device with the rising edge of SCLK. Data is output from the device on the falling edge of SCLK.

Each read/write operation is framed by signal SDENB (Serial Data Enable Bar) asserted low for 2 to 5 bytes, depending on the data length to be transferred (1–4 bytes). The first frame byte is the instruction cycle which identifies the following data transfer cycle as read or write, how many bytes to transfer, and what address to transfer the data. [Table 2](#) indicates the function of each bit in the instruction cycle and is followed by a detailed description of each bit. Frame bytes 2 to 5 comprise the data transfer cycle.

Table 2. Instruction Byte of the Serial Interface

	MSB				LSB			
Bit	7	6	5	4	3	2	1	0
Description	R/W	N1	N0	A4	A3	A2	A1	A0

R/W Identifies the following data transfer cycle as a read or write operation. A high indicates a read operation from DAC3283 and a low indicates a write operation to DAC3283.

[N1:N0] Identifies the number of data bytes to be transferred per [Table 3](#). Data is transferred MSB first.

Table 3. Number of Transferred Bytes Within One Communication Frame

N1	N0	Description
0	0	Transfer 1 Byte
0	1	Transfer 2 Bytes
1	0	Transfer 3 Bytes
1	1	Transfer 4 Bytes

[A4:A0] Identifies the address of the register to be accessed during the read or write operation. For multi-byte transfers, this address is the starting address. Note that the address is written to the DAC3283 MSB first and counts down for each byte.

[Figure 32](#) shows the serial interface timing diagram for a DAC3283 write operation. SCLK is the serial interface clock input to DAC3283. Serial data enable SDENB is an active low input to DAC3283. SDIO is serial data in. Input data to DAC3283 is clocked on the rising edges of SCLK.

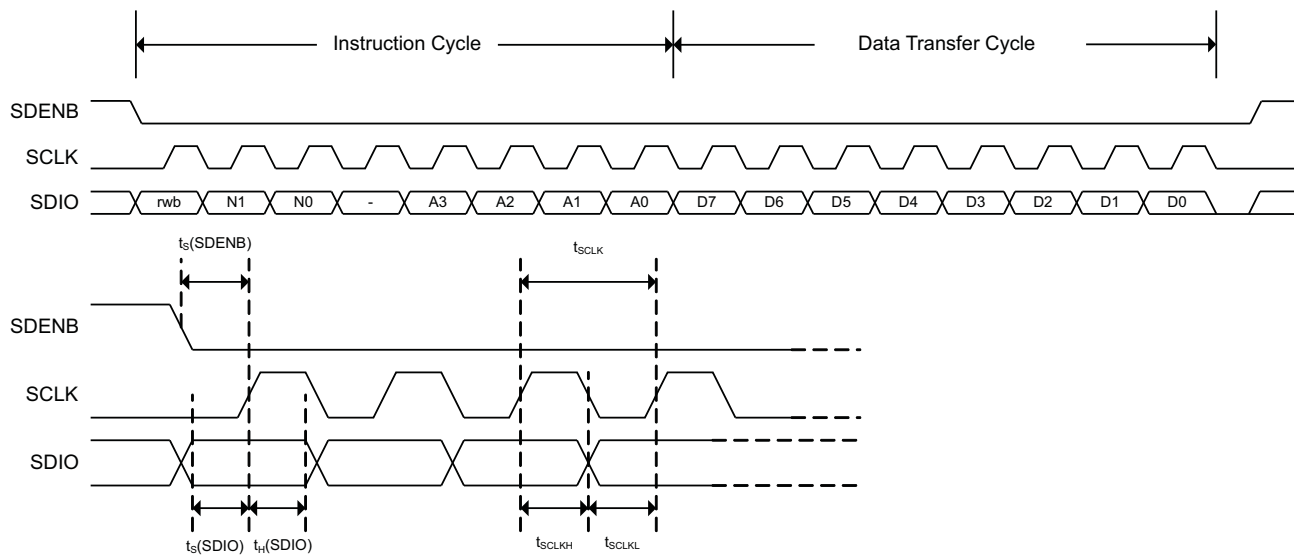

Figure 32. Serial Interface Write Timing Diagram

Figure 33 shows the serial interface timing diagram for a DAC3283 read operation. SCLK is the serial interface clock input to DAC3283. Serial data enable SDENB is an active low input to DAC3283. SDIO is serial data in during the instruction cycle. In 3 pin configuration, SDIO is data out from DAC3283 during the data transfer cycle(s), while ALARM_SDO is in a high-impedance state. In 4 pin configuration, both ALARM_SDO and SDIO are data out from DAC3283 during the data transfer cycle(s). At the end of the data transfer, ALARM_SDO will output low on the final falling edge of SCLK until the rising edge of SDENB when it will 3-state.

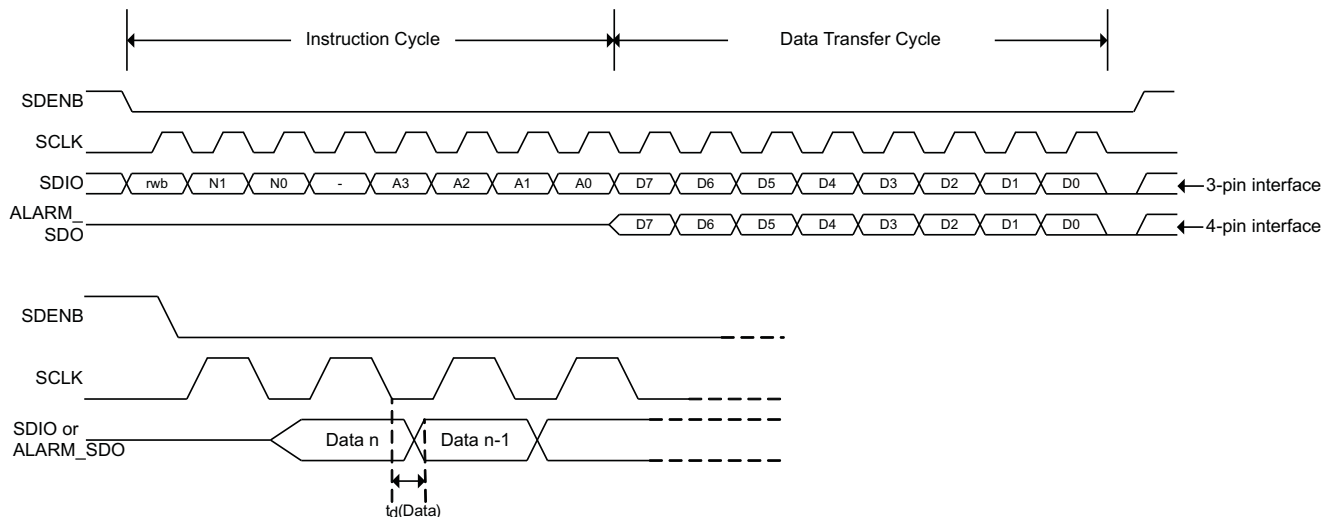

Figure 33. Serial Interface Read Timing Diagram

DATA INTERFACE

The DAC3283 has a single 8-bit LVDS bus that accepts dual, 16-bit data input in byte-wide format. Data into the DAC3283 is formatted according to the diagram shown in Figure 34 where index 0 is the data LSB and index 15 is the data MSB. The data is sampled by DATACLK, a double data rate (DDR) clock.

The FRAME signal is required to indicate the beginning of a frame. The frame signal can be either a pulse or a periodic signal where the frame period corresponds to 8 samples. The pulse-width (t_{FRAME}) needs to be at least equal to $\frac{1}{2}$ of the DATACLK period. FRAME is sampled by a rising edge in DATACLK.

The setup and hold requirements listed in the specifications tables must be met to ensure proper sampling.

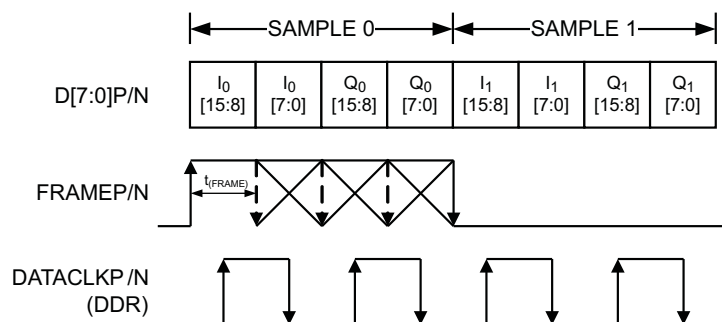

Figure 34. Byte-Wide Data Transmission Format

INPUT FIFO

The DAC3283 includes a 2-channel, 16-bits wide and 8-samples deep input FIFO which acts as an elastic buffer. The purpose of the FIFO is to absorb any timing variations between the input data and the internal DAC data rate clock such as the ones resulting from clock-to-data variations from the data source.

Figure 35 shows a simplified block diagram of the FIFO.

Figure 35. DAC3283 FIFO Block Diagram

Data is written to the device 8-bits at a time on the rising and falling edges of DATACLK. In order to form a complete 32-bit wide sample (16-bit I-data and 16-bit Q-data) two DATACLK periods are required as shown in Figure 36. Each 32-bit wide sample is written into the FIFO at the address indicated by the write pointer. Similarly, data from the FIFO is read by the FIFO Out Clock 32-bits at a time from the address indicated by the read pointer. The FIFO Out Clock is generated internally from the DACCLK signal and its rate is equal to DACCLK/Interpolation. Each time a FIFO write or FIFO read is done the corresponding pointer moves to the next address.

The reset position for the FIFO read and write pointers is set by default to addresses 0 and 4 as shown in Figure 35. This offset gives optimal margin within the FIFO. The default read pointer location can be set to another value using `fifo_offset(2:0)` in register CONFIG3. Under normal conditions data is written-to and read-from the FIFO at the same rate and consequently the write and read pointer gap remains constant. If the FIFO write and read rates are different, the corresponding pointers will be cycling at different speeds which could result in pointer collision. Under this condition the FIFO attempts to read and write data from the same address at the same time which will result in errors and thus must be avoided.

The FRAME signal besides acting as a frame indicator can also be used to reset the FIFO pointers to their initial location. Unlike Data, the FRAME signal is latched only on the rising edges of DATACLK. When a rising edge occurs on FRAME, the pointers will return to their original position. The write pointer is always set back to position 0 upon reset. The read pointer reset position is determined by `fifo_offset` (address 4 by default).

Similarly, the read pointer sync source is selected by `multi_sync_sel` (CONFIG19). Either the FRAME or OSTR signal can be set to reset the read pointer. If FRAME is used to reset the read pointer, the FIFO Out Clock will recapture the FRAME signal to reset the read pointer. This clock domain transfer (DATACLK to FIFO Out Clock) results in phase ambiguity of the reset signal. This limits the precise control of the output timing and makes full synchronization of multiple devices difficult.

To alleviate this, the device offers the alternative of resetting the FIFO read pointer independently of the write pointer by using the OSTR signal. The OSTR signal is sampled by DACCLK and must satisfy the timing requirements in the specification table. In order to minimize the skew it is recommended to use the same clock distribution device such as Texas Instruments CDCE62005 to provide the DACCLK and OSTR signals to all the DAC3283 devices in the system. Swapping the polarity of the DACCLK output with respect to the OSTR output establishes proper phase relationship.

The FIFO pointers reset procedure can be done periodically or only once during initialization as the pointers automatically return to the initial position when the FIFO has been filled. To reset the FIFO periodically, it is necessary to have FRAME and OSTR signals to repeat at multiple of 8 FIFO samples. To disable FIFO reset, set `fifo_reset_ena` and `multi_sync_ena` (CONFIG0) to 0.

The frequency limitation for the FRAME signal is the following:

$$f_{\text{SYNC}} = f_{\text{DATACLK}} / (n \times 16) \text{ where } n = 1, 2, \dots$$

The frequency limitation for the OSTR signal is the following:

$$f_{\text{OSTR}} = f_{\text{DAC}} / (n \times \text{interpolation} \times 8) \text{ where } n = 1, 2, \dots$$

The frequencies above are at maximum when $n = 1$. This is when FRAME and OSTR have a rising edge transition every 8 FIFO samples. The occurrence can be made less frequently by setting $n > 1$, for example, every $n \times 8$ FIFO samples.

Figure 36. FIFO Write Description

FIFO ALARMS

The FIFO only operates correctly when the write and read pointers are positioned properly. If either pointer over or under runs the other, samples will be duplicated or skipped. To prevent this, register CONFIG7 can be used to track three FIFO related alarms:

- alarm_fifo_2away. Occurs when the pointers are within two addresses of each other.
- alarm_fifo_1away. Occurs when the pointers are within one address of each other.
- alarm_fifo_collision. Occurs when the pointers are equal to each other.

These three alarm events are generated asynchronously with respect to the clocks and can be accessed either through CONFIG7 or through the ALARM_SDO pin.

FIFO MODES OF OPERATION

The DAC3283 FIFO can be completely bypassed through registers *config0* and *config19*. The register configuration for each mode is described in Table 4.

Register	Control Bits
config0	fifo_ena, fifo_reset_ena, multi_sync_ena
config19	multi_sync_sel

Table 4. FIFO Operation Modes

Config1 FIFO Bits				Config19
FIFO Mode	fifo_ena	fifo_reset_ena	multi_sync_ena	multi_sync_sel
Dual Sync Sources	1	1	1	0
Single Sync Source	1	1	1	1
Bypass	0	X	X	X

DUAL SYNC SOURCES MODE

This is the recommended mode of operation for those applications that require precise control of the output timing. In Dual Sync Sources mode, the FIFO write and read pointers are reset independently. The FIFO write pointer is reset using the LVDS FRAME signal, and the FIFO read pointer is reset using the LVPECL OSTR signal. This allows LVPECL OSTR signal to control the phase of the output for either a single chip or multiple chips. Multiple devices can be fully synchronized in this mode.

SINGLE SYNC SOURCE MODE

In Single Sync Source mode, the FIFO write and read pointers are reset from the LVDS FRAME signal. This mode has a possibility of up to 2 DAC clocks offset between the outputs of multiple devices (The DAC outputs of the same device maintain the same phase). Applications requiring exact output timing control will need Dual Sync Sources mode instead of Single Sync Source mode. A rising edge for FIFO and clock divider sync is recommended. Periodic sync signal is not recommended due to non-deterministic latency of the sync signal through the clock domain transfer.

BYPASS MODE

In FIFO bypass mode, the FIFO block is not used. As a result the input data is handed off from the DATACLK to the DACCLK domain without any compensation. In this mode the relationship between DATACLK and DACCLK (t_{align}) is critical and used as a synchronizing mechanism for the internal logic. Due to the t_{align} constraint it is highly recommended that a clock synchronizer device such as Texas Instruments' CDCM7005 or CDCE62005 is used to provide both clock inputs. In bypass mode the pointers have no effect on the data path or handoff.

MULTI-DEVICE OPERATION

In various applications, such as multi antenna systems where the various transmit channels information is correlated, it is required that multiple DAC devices are completely synchronized such that their outputs are phase aligned. The DAC3283 architecture supports this mode of operation.

MULTI-DEVICE SYNCHRONIZATION: DUAL SYNC SOURCES MODE

For single or multi-device synchronization it is important that delay differences in the data are absorbed by the device so that latency through the device remains the same. Furthermore, to guarantee that the outputs from each DAC are phase aligned it is necessary that data is read from the FIFO of each device simultaneously. In the DAC3283 this is accomplished by operating the multiple devices in Dual Sync Sources mode. In this mode the additional OSTR signal is required by each DAC3283 to be synchronized.

Data into the device is input as LVDS signals from one or multiple baseband ASICs or FPGAs. Data into the multiple DAC devices can experience different delays due to variations in the digital source output paths or board level wiring. These different delays can be effectively absorbed by the DAC3283 FIFO so that all outputs are phase aligned correctly.

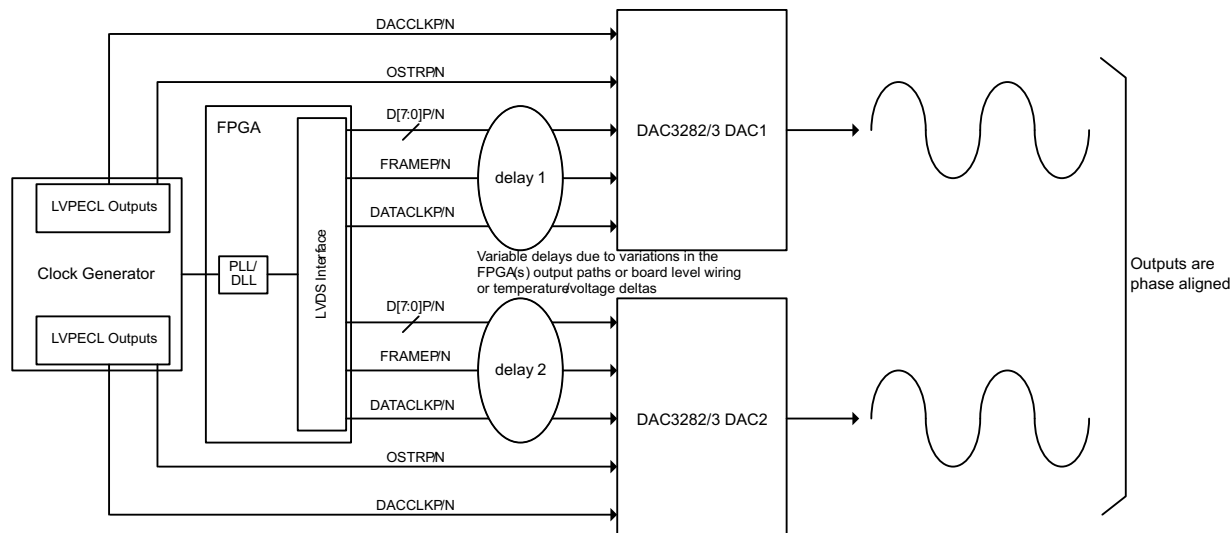

Figure 37. Synchronization System in Dual Sync Sources Mode

For correct operation both OSTR and DACCLK must be generated from the same clock domain. The OSTR signal is sampled by DACCLK and must satisfy the timing requirements in the specifications table. If the clock generator does not have the ability to delay the DACCLK to meet the OSTR timing requirement, the polarity of the DACCLK outputs can be swapped with respect to the OSTR ones to create 180 degree phase delay of the DACCLK. This may help establish proper setup and hold time requirement of the OSTR signal.

Careful board layout planning must be done to ensure that the DACCLK and OSTR signals are distributed from device to device with the lowest skew possible as this will affect the synchronization process. In order to minimize the skew across devices it is recommended to use the same clock distribution device to provide the DACCLK and OSTR signals to all the DAC devices in the system.

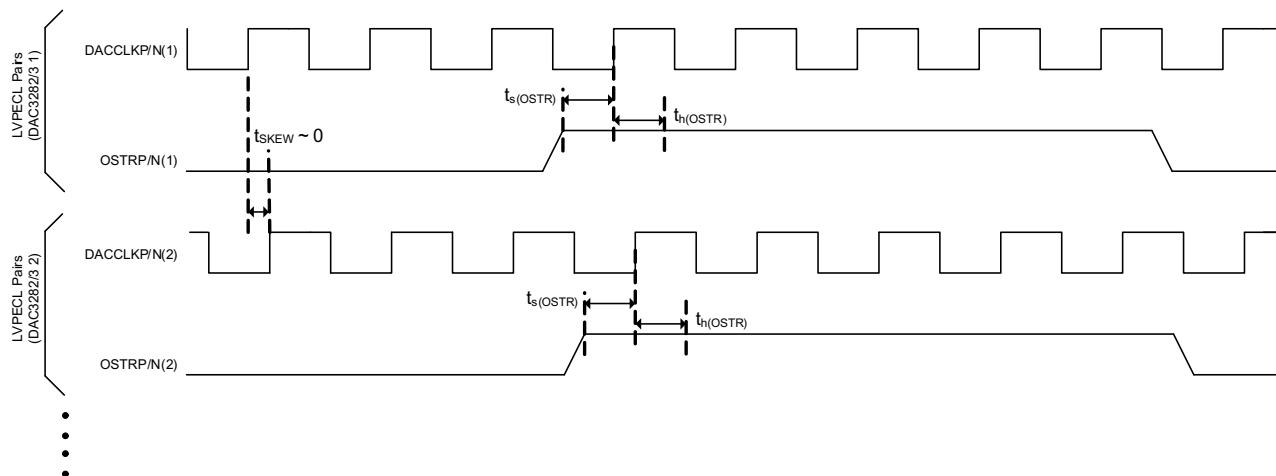

Figure 38. Timing Diagram for LVPECL Synchronization Signals

The following steps are required to ensure the devices are fully synchronized. The procedure assumes all the DAC3283 devices have a DACCLK and OSTR signal and the following steps must be carried out on each device.

- Start-up the device as described in the power-up sequence. Set the DAC3283 in Dual Sync Sources mode and select OSTR as the FIFO output pointer sync source and clock divider sync source (*multi_sync_sel* in register *config19*).
- Sync the clock divider and FIFO pointers.

- Verify there are no FIFO alarms either through register *config7* or through the ALARM_SDO pin.

After these steps all the DAC3283 outputs will be synchronized.

MULTI-DEVICE OPERATION: SINGLE SYNC SOURCE MODE

In Single Sync Source mode, the FIFO write and read pointers are reset from the same FRAME source. Although the FIFO in this mode can still absorb the data delay differences due to variations in the digital source output paths or board level wiring, it is impossible to guarantee data will be read from the FIFO of different devices simultaneously thus preventing exact phase alignment.

The FIFO read pointer reset is handoff between the two clock domains (DATACLK and FIFO OUT CLOCK) by simply re-sampling the write pointer reset. Since the two clocks are asynchronous there is a small but distinct possibility of a meta-stability during the pointer handoff. This meta-stability can cause the outputs of the multiple devices to slip by up to 2 DAC clock cycles.

Figure 39. Multi-Device Operation in Single Sync Source Mode

DATA PATTERN CHECKER

The DAC3283 incorporates a simple pattern checker test in order to determine errors in the data interface. The main cause of failures is setup/hold timing issues. The test mode is enabled by asserting *iotest_ena* in register *config1*. In test mode the analog outputs are deactivated regardless of the state of TXENABLE.

The data pattern key used for the test is 8 words long and is specified by the contents of *iotest_pattern[0:7]* in registers *config9* through *config16*. The data pattern key can be modified by changing the contents of these registers.

The first word in the test frame is determined by a rising edge transition in FRAME. At this transition, the *pattern0* word should be input to the data pins. Patterns 1 through 7 should follow sequentially on each edge of DATACLK (rising and falling). The sequence should be repeated until the pattern checker test is disabled by setting *iotest_ena* back to "0". It is not necessary to have a rising FRAME edge aligned with every *pattern0* word, just the first one to mark the beginning of the series.

Figure 40. IO Pattern Checker Data Transmission Format

The test mode determines if the 8-bit LVDS data D[7:0]P/N of all the patterns were received correctly by comparing the received data against the data pattern key. If any of the 8-bit data D[7:0]P/N were received incorrectly, the corresponding bits in *iotest_results(7:0)* in register *config8* will be set to "1" to indicate bit error location. Furthermore, the error condition will trigger the *alarm_from_iotest* bit in register *config7* to indicate a general error in the data interface. When data pattern checker mode is enabled, this alarm in register *config7*, bit 3 is the only valid alarm. Other alarms in register *config7* are not valid and can be disregarded.

For instance, pattern0 is programmed to the default of 0x7A. If the received Pattern 0 is 0x7B, then bit 0 in *iotest_results(7:0)* will be set to "1" to indicate an error in bit 0 location. The *alarm_from_iotest* will also be set to "1" to report the data transfer error. The user can then narrow down the error from the bit location information and implement the fix accordingly.

The alarms can be cleared by writing 0x00 to *iotest_results(7:0)* and "0" to *alarm_from_iotest* through the serial interface. The serial interface will read back 0s if there are no errors or if the errors are cleared. The corresponding alarm bit will remain a "1" if the errors remain.

It is recommended to enable the pattern checker and then run the pattern sequence for 100 or more complete cycles before clearing the *iotest_results(7:0)* and *alarm_from_iotest*. This will eliminate the possibility of false alarms generated during the setup sequence.

Figure 41. DAC3283 Pattern Check Block Diagram

DATACLK MONITOR

The DAC3283 incorporates a clock monitor to determine if DATACLK is present. A missing DATACLK may result in unexpected DAC outputs. As shown in Figure 42, the clock monitor circuit is a simple counter circuit. It is reset on each rising edge of DATACLK, and counts up with each rising edge of FIFOOUT_CLK. The output of the counter has two latches: clk_alarm latch and tx_off latch. If the missing DATACLK is registered by the clock monitor circuit after the counter reached the count of four, it will send a pulse to the two latches, which issue two alarms, respectively.

Figure 42. DATACLK Monitor Circuit

CIRCUIT	FUNCTIONS	REGISTER LOCATION	STATE	DESCRIPTION
clk_alarm latch	clk_alarm_mask	CONFIG17, bit4 read/write	1	masks the alarm signal to the CMOS ALARM_SDO
			0	unmasks the alarm signal to the CMOS ALARM_SDO
	clk_alarm_ena	CONFIG17, bit1 read/write	1	clears the latch and enables the clock loss monitoring
			0	holds the latch at reset at all times
	clk_alarm	VERSION31, bit7 read-only	1	indicates clock loss event
			0	indicates normal operation
tx_off latch	tx_off_mask	CONFIG17, bit3 read/write	1	masks the alarm signal to the CMOS ALARM_SDO
			0	unmasks the alarm signal to the CMOS ALARM_SDO
	tx_off_ena	CONFIG17, bit0 read/write	1	clears the latch and enables the clock loss monitoring
			0	holds the latch at reset at all times
	tx_off	VERSION31, bit6 read-only	1	indicates output disabled event
			0	indicates normal operation

The purpose of the clk_alarm latch is to register the loss of DATACLK event. Upon the event, the latch will issue a read-only clk_alarm alarm. This latch can be held reset at all time by setting clk_alarm_ena = '0' at all time.

The purpose of the tx_off latch is to disable the output when the DATACLK is lost. Upon the event, the latch will issue a read-only tx_off alarm. When this alarm is set, the DAC3283 outputs are automatically disabled by setting output data to mid-scale. This latch can be held reset at all time by setting tx_off_ena = '0' at all time.

Both alarms are set by default to trigger the ALARM_SDO pin in 3-pin SPI mode. By writing clk_alarm_mask and tx_off_mask to '1', the ALARM_SDO will ignore these two alarms. This may be useful if the ALARM_SDO is needed to report other critical alarms in the interrupt routine.

These two latches can be held reset at all times, effectively ignoring any clock monitor output, by setting clk_alarm_ena and tx_off_ena to '0'. When a '0' is written to either of these two register bits, it will force the latch output low. For the latches to report an error, the clk_monitor_ena and tx_off_ena must be written to a '0' and then a '1'.

The clock monitoring function is implemented as follows:

1. Power up the device using the recommended power-up sequence.
 - (a) Configure the device using the SPI bus.
 - (b) Provide both the DATACLK and DACCLK.
2. Reset the clock monitor circuit and the latches by writing `clk_alarm_ena` and `tx_off_ena` a '0', and then '1' in CONFIG17.
3. Unmask the alarms by setting `clk_alarm_mask` and `tx_off_mask` to '0' in CONFIG17.

If the DATACLK is interrupted, the ALARM_SDO pin will transition to indicate error. The interrupt service routine can check the following:

1. Read `clk_alarm` and `tx_off` in CONFIG31 and other alarms in CONFIG7 to determine the error that triggered the alarm.
2. If `clk_alarm` and `tx_off` alarms are set in CONFIG31, then DATACLK was interrupted and the DAC outputs should be set to mid-scale.
3. Implement system check to recover the DATACLK.
4. Reset the clock monitor circuit and `clk_alarm` latch by writing `clk_alarm_ena` a '0', and then '1' in CONFIG17.
5. Read `clk_alarm` in CONFIG31 to verify if the clock loss event has not re-triggered the alarm.
6. Once the clock monitor indicates the DATACLK is stable, resynchronize the FIFO. See Power-Up Sequence section for detail.
7. Reset the transmit disable latch by writing `tx_off_ena` a '0', and then '1' in CONFIG17. This will re-enable the DAC to output actual data.

NOTE

The ALARM_SDO pin in 4-pin SPI mode functions as SPI register data output. The system will need to poll VERSION31 alarms frequently in order to detect the DATACLK interruption errors.

FIR FILTERS

Figure 43 and Figure 44 show the magnitude spectrum response for the FIR0 and FIR1 interpolating half-band filters where f_{IN} is the input data rate to the FIR filter. Figure 45 and Figure 46 show the composite filter response for 2x and 4x interpolation. The transition band for all the interpolation settings is from 0.4 to $0.6 \times f_{DATA}$ (the input data rate to the device) with $< 0.002\text{dB}$ of pass-band ripple and $> 85\text{dB}$ stop-band attenuation.

The filter taps for all digital filters are listed in Table 5.

COARSE MIXER

The DAC3283 has a coarse mixer block capable of shifting the input signal spectrum by the fixed mixing frequencies $f_s/2$ or $f_s/4$. The coarse mixing function is built into the interpolation filters and thus FIR0 (2x interpolation) or FIR0 and FIR1 (4x interpolation) must be enabled to use it.

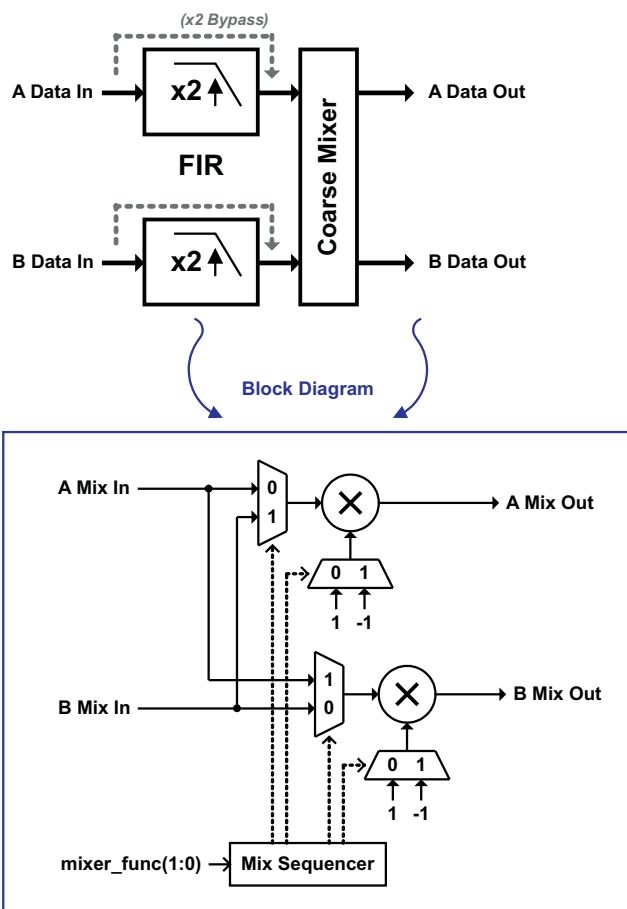

Treating channels A and B as a complex vector of the form $I(t) + j Q(t)$, where $I(t) = A(t)$ and $Q(t) = B(t)$, the outputs of the coarse mixer, $A_{OUT}(t)$ and $B_{OUT}(t)$ are equivalent to:

$$A_{OUT}(t) = A(t)\cos(2\pi f_{CMIX}t) - B(t)\sin(2\pi f_{CMIX}t)$$

$$B_{OUT}(t) = A(t)\sin(2\pi f_{CMIX}t) + B(t)\cos(2\pi f_{CMIX}t)$$

where f_{CMIX} is the fixed mixing frequency selected by mixer_func(1:0). For $f_s/2$, $+f_s/4$ and $-f_s/4$ the above operations result in the simple mixing sequences shown in [Table 6](#).

Mode	mixer_func(1:0)	Mixing Sequence
Normal (Low Pass, No Mixing)	00	A _{OUT} = { +A, +A , +A, +A } B _{OUT} = { +B, +B , +B, +B }
f _S /2	01	A _{OUT} = { +A, −A , +A, −A } B _{OUT} = { +B, −B , +B, −B }
+f _S /4	10	A _{OUT} = { +A, −B , −A, +B } B _{OUT} = { +B, +A , −B, −A }
−f _S /4	11	A _{OUT} = { +A, +B , −A, −B } B _{OUT} = { +B, −A , −B, +A }

The coarse mixer in the DAC3283 treats the A and B inputs as complex input data and for most mixing frequencies produces a complex output. Only when the mixing frequency is set to $f_s/2$ the A and B channels can be maintained isolated as shown in Table 6. In this case the two channels are upconverted as independent signals. By setting the mixer to $f_s/2$ the interpolation filter outputs are inverted thus behaving as a high-pass filter.

FIR MODE	INPUT FREQUENCY ⁽¹⁾	OUTPUT FREQUENCY ⁽¹⁾	SIGNAL BANDWIDTH ⁽¹⁾	SPECTRUM INVERTED?
Low Pass	0.0 to $0.4 \times f_{\text{DATA}}$	0.0 to $0.4 \times f_{\text{DATA}}$	$0.4 \times f_{\text{DATA}}$	No
High Pass	0.0 to $0.4 \times f_{\text{DATA}}$	0.6 to $1.0 \times f_{\text{DATA}}$	$0.4 \times f_{\text{DATA}}$	Yes

QUADRATURE MODULATION CORRECTION (QMC)

The Quadrature Modulator Correction (QMC) block provides a means for adjusting the gain and phase of the complex signal. At a quadrature modulator output, gain and phase imbalances result in an undesired sideband signal.

The block diagram for the QMC is shown in [Figure 48](#). The QMC block contains 3 programmable parameters: qmc_gaina(10:0), qmc_gainb(10:0) and qmc_phase(9:0).

Registers qmc_gaina(10:0) and qmc_gainb(10:0) control the I and Q path gains and are 11 bit values with a range of 0 to approximately 2. This value is used to scale the signal range. Register qmc_phase(9:0) controls the phase imbalance between I and Q and is a 10-bit value that ranges from $-1/8$ to approximately $+1/8$. This value is multiplied by each Q sample then summed into the I sample path. This operation is a simplified approximation of a true phase rotation and covers the range from -7.125 to $+7.125$ degrees in 1024 steps.

A write to register CONFIG27 is required to load the gain and phase values (CONFIG27-CONFIG30) into the QMC block simultaneously. When updating the gain and/or phase values CONFIG27 should be written last. Programming any of the other three registers will not affect the gain and phase settings.

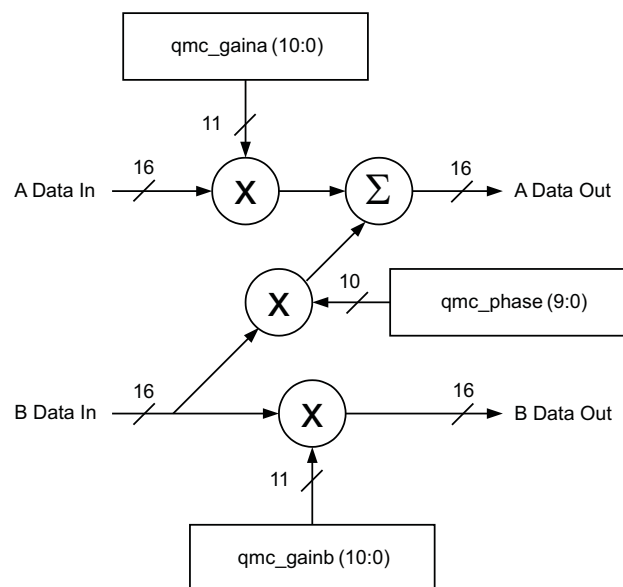

Figure 48. QMC Block Diagram

DIGITAL OFFSET CONTROL

The qmc_offseta(12:0) and qmc_offsetb(12:0) values in registers CONFIG20 through CONFIG23 can be used to independently adjust the A and B path DC offsets. Both offset values are represented in 2s-complement format with a range from -4096 to 4095 .

Note that a write to register CONFIG20 is required to load the values of all four qmc_offset registers (CONFIG20-CONFIG23) into the offset block simultaneously. When updating the offset values CONFIG20 should be written last. Programming any of the other three registers will not affect the offset setting.

The offset value adds a digital offset to the digital data before digital-to-analog conversion. Since the offset is added directly to the data it may be necessary to back off the signal to prevent saturation. Both data and offset values are LSB aligned.

Figure 49. Digital Offset Block Diagram

TEMPERATURE SENSOR

The DAC3283 incorporates a temperature sensor block which monitors the temperature by measuring the voltage across 2 transistors. The voltage is converted to an 8-bit digital word using a successive-approximation (SAR) analog to digital conversion process. The result is scaled, limited and formatted as a two's complement value representing the temperature in degrees Celsius.

The sampling is controlled by the serial interface signals SDENB and SCLK. If the temperature sensor is enabled (*tsense_ena* = 1 in register CONFIG24) a conversion takes place each time the serial port is written or read. The data is only read and sent out by the digital block when the temperature sensor is read in register CONFIG5. The conversion uses the first eight clocks of the serial clock as the capture and conversion clock, the data is valid on the falling eighth SCLK. The data is then clocked out of the chip on the rising edge of the ninth SCLK. No other clocks to the chip are necessary for the temperature sensor operation. As a result the temperature sensor is enabled even when the device is in sleep mode.

In order for the process described above to operate properly, the serial port read from CONFIG5 must be done with an SCLK period of at least 1μs. If this is not satisfied the temperature sensor accuracy is greatly reduced.

POWER-UP SEQUENCE

The following startup sequence is recommended to power-up the DAC3283:

1. Set TXENABLE low.
2. Supply all 1.8V voltages (DACVDD, DIGVDD, CLKVDD and VFUSE) and all 3.3V voltages (AVDD). The 1.8V and 3.3V supplies can be powered up simultaneously or in any order. There are no specific requirements on the ramp rate for the supplies.
3. Provide all LVPECL inputs: DACCLKP/N and the optional OSTRP/N. These inputs can also be provided after the SIF register programming.
4. Program all the SIF registers. Also program default value to the registers not being used.
5. FIFO configuration needed for synchronization:
 - (a) Program *fifo_reset_ena* (config0, bit<5>) to enable FRAMEP/N as the FIFO input pointer sync source.
 - (b) Program *multi_sync_ena* (config0, bit<4>) to enable syncing of the FIFO output pointer.
 - (c) Program *multi_sync_sel* (config19, bit<1>) to select the FIFO output pointer and clock divider sync source
6. Clock divider configuration needed for synchronization:
 - (a) Program *clkdiv_sync_ena* (config18, bit<1>) to "1" to enable clock divider sync.
7. Provide all LVDS inputs (D[7:0]P/N, DATACLKP/N, and FRAMEP/N) simultaneously. Synchronize the FIFO and clock divider by providing the pulse or periodic signals needed.
 - (a) For Single Sync Source Mode where FRAMEP/N is used to sync the FIFO, a single rising edge for FIFO, FIFO data formatter, and clock divider sync is recommended. Periodic sync signal is not recommended due to the non-deterministic latency of the sync signal through the clock domain transfer.
 - (b) For Dual Sync Sources Mode, either single pulse or periodic sync signals can be used.

8. FIFO and clock divider configurations after all the sync signals have provided the initial sync pulses needed for synchronization:
 - (a) For Single Sync Source Mode where the clock divider sync source is FRAMEP/N, clock divider syncing may be disabled after DAC3283 initialization and before the data transmission by setting *clkdiv_sync_ena* (config18, bit<1>) to "0". This is to prevent accidental syncing of the clock divider when sending FRAMEP/N pulse to other digital blocks.
 - (b) For Dual Sync Sources Mode, where the clock divider sync source is from the OSTRP/N, the clock divider syncing may be enabled at all time.
 - (c) Optionally, to prevent accidental syncing of the FIFO, disable FIFO syncing by setting *fifo_reset_ena* and *multi_sync_ena* to "0" after the FIFO input and output pointers are initialized. If the FIFO sync remains enabled after initialization, the FRAMEP/N pulse must occur in ways to not disturb the FIFO operation. Refer to the INPUT FIFO section for detail.
9. Enable transmit of data by asserting the TXENABLE pin.
10. At all times, if any of the clocks (i.e. DATACLK or DACCLK) is lost or FIFO collision alarm is detected, a complete resynchronization of the DAC is necessary. Set TXENABLE low and repeat step 5 through 9. Program the FIFO configuration and clock divider configuration per step 5 and 6 appropriately to accept the new sync pulse or pulses for the synchronization.

SLEEP MODES

The DAC3283 features independent sleep control of each DAC (*sleepa* and *sleepb*), their corresponding clock path (*clkpath_sleep_a* and *clkpath_sleep_b*) as well as the clock input receiver of the device (*clkrecv_sleep*). The sleep control of each of these components is done through the SIF interface and is enabled by setting a 1 to the corresponding sleep register.

Complete power down of the device is set by setting all of these components to sleep. Under this mode the supply power consumption is reduced to 15mW. Power-up time in this case will be in the milliseconds range. Alternatively for those applications where power-up and power-down times are critical it is recommended to only set the DACs to sleep through the *sleepa* and *sleepb* registers. In this case both the sleep and wake-up times are only 90µs.

LVPECL INPUTS

Figure 50 shows an equivalent circuit for the DAC input clock (DACCLP/N) and the output strobe clock (OSTRP/N).

CMOS DIGITAL INPUTS

Figure 54 shows a schematic of the equivalent CMOS digital inputs of the DAC3283. SDIO, SCLK and TXENABLE have pull-down resistors while SDENB has a pull-up resistors internal to the DAC3283. See the specification table for logic thresholds. The pull-up and pull-down circuitry is approximately equivalent to 100kΩ.

**Figure 54. CMOS/TTL Digital Equivalent Input**

REFERENCE OPERATION

The DAC3283 uses a bandgap reference and control amplifier for biasing the full-scale output current. The full-scale output current is set by applying an external resistor R_{BIAS} to pin BIASJ. The bias current I_{BIAS} through resistor R_{BIAS} is defined by the on-chip bandgap reference voltage and control amplifier. The default full-scale output current equals 16 times this bias current and can thus be expressed as:

$$I_{OUTFS} = 16 \times I_{BIAS} = 16 \times V_{EXTIO} / R_{BIAS}$$

Each DAC has a 4-bit coarse gain control via **coarse_daca(3:0)** and **coarse_dacb (3:0)** in the CONFIG4 register. Using gain control, the I_{OUTFS} can be expressed as:

$$I_{OUTAFS} = (DACA_gain + 1) \times I_{BIAS} = (DACA_gain + 1) \times V_{EXTIO} / R_{BIAS}$$

$$I_{OUTBFS} = (DACB_gain + 1) \times I_{BIAS} = (DACB_gain + 1) \times V_{EXTIO} / R_{BIAS}$$

where V_{EXTIO} is the voltage at terminal EXTIO. The bandgap reference voltage delivers an accurate voltage of 1.2V. This reference is active when **extref_ena** = '0' in CONFIG25. An external decoupling capacitor C_{EXT} of 0.1μF should be connected externally to terminal EXTIO for compensation. The bandgap reference can additionally be used for external reference operation. In that case, an external buffer with high impedance input should be applied in order to limit the bandgap load current to a maximum of 100nA. The internal reference can be disabled and overridden by an external reference by setting the CONFIG25 **extref_ena** control bit. Capacitor C_{EXT} may hence be omitted. Terminal EXTIO thus serves as either input or output node.

The full-scale output current can be adjusted from 20mA down to 2mA by varying resistor R_{BIAS} or changing the externally applied reference voltage. The internal control amplifier has a wide input range, supporting the full-scale output current range of 20dB.

DAC TRANSFER FUNCTION

The CMOS DAC's consist of a segmented array of NMOS current sinks, capable of sinking a full-scale output current up to 20mA. Differential current switches direct the current to either one of the complementary output nodes IOUT1 or IOUT2. (DACA = IOUTA1 or IOUTA2 and DACB = IOUTB1 or IOUTB2.) Complementary output currents enable differential operation, thus canceling out common mode noise sources (digital feed-through, on-chip and PCB noise), dc offsets, even order distortion components, and increasing signal output power by a factor of two.

The full-scale output current is set using external resistor R_{BIAS} in combination with an on-chip bandgap voltage reference source (+1.2V) and control amplifier. Current I_{BIAS} through resistor R_{BIAS} is mirrored internally to provide a maximum full-scale output current equal to 16 times I_{BIAS} .

The relation between IOUT1 and IOUT2 can be expressed as:

$$IOUT1 = -IOUTFS - IOUT2$$

Current flowing into a node is denoted as – current and current flowing out of a node as + current. Since the output stage is a current sink the current can only flow from AVDD into the IOUT1 and IOUT2 pins. The output current flow in each pin driving a resistive load can be expressed as:

$$IOUT1 = IOUTFS \times (65535 - CODE) / 65536$$

$$IOUT2 = IOUTFS \times CODE / 65536$$

where CODE is the decimal representation of the DAC data input word.

For the case where IOUT1 and IOUT2 drive resistor loads R_L directly, this translates into single ended voltages at IOUT1 and IOUT2:

$$VOUT1 = AVDD - |IOUT1| \times R_L$$

$$VOUT2 = AVDD - |IOUT2| \times R_L$$

Assuming that the data is full scale (65536 in offset binary notation) and the R_L is 25 Ω , the differential voltage between pins IOUT1 and IOUT2 can be expressed as:

$$VOUT1 = AVDD - |-0 \text{ mA}| \times 25 \Omega = 3.3 \text{ V}$$

$$VOUT2 = AVDD - |-20 \text{ mA}| \times 25 \Omega = 2.8 \text{ V}$$

$$V_{DIFF} = VOUT1 - VOUT2 = 0.5 \text{ V}$$

Note that care should be taken not to exceed the compliance voltages at node IOUT1 and IOUT2, which would lead to increased signal distortion.

ANALOG CURRENT OUTPUTS

Figure 55 shows a simplified schematic of the current source array output with corresponding switches. Differential switches direct the current of each individual NMOS current source to either the positive output node IOUT1 or its complementary negative output node IOUT2. The output impedance is determined by the stack of the current sources and differential switches, and is typically >300 k Ω in parallel with an output capacitance of 5 pF.

The external output resistors are referenced to an external ground. The minimum output compliance at nodes IOUT1 and IOUT2 is limited to $AVDD - 0.5 \text{ V}$, determined by the CMOS process. Beyond this value, transistor breakdown may occur resulting in reduced reliability of the DAC3283 device. The maximum output compliance voltage at nodes IOUT1 and IOUT2 equals $AVDD + 0.5 \text{ V}$. Exceeding the minimum output compliance voltage adversely affects distortion performance and integral non-linearity. The optimum distortion performance for a single-ended or differential output is achieved when the maximum full-scale signal at IOUT1 and IOUT2 does not exceed 0.5 V.

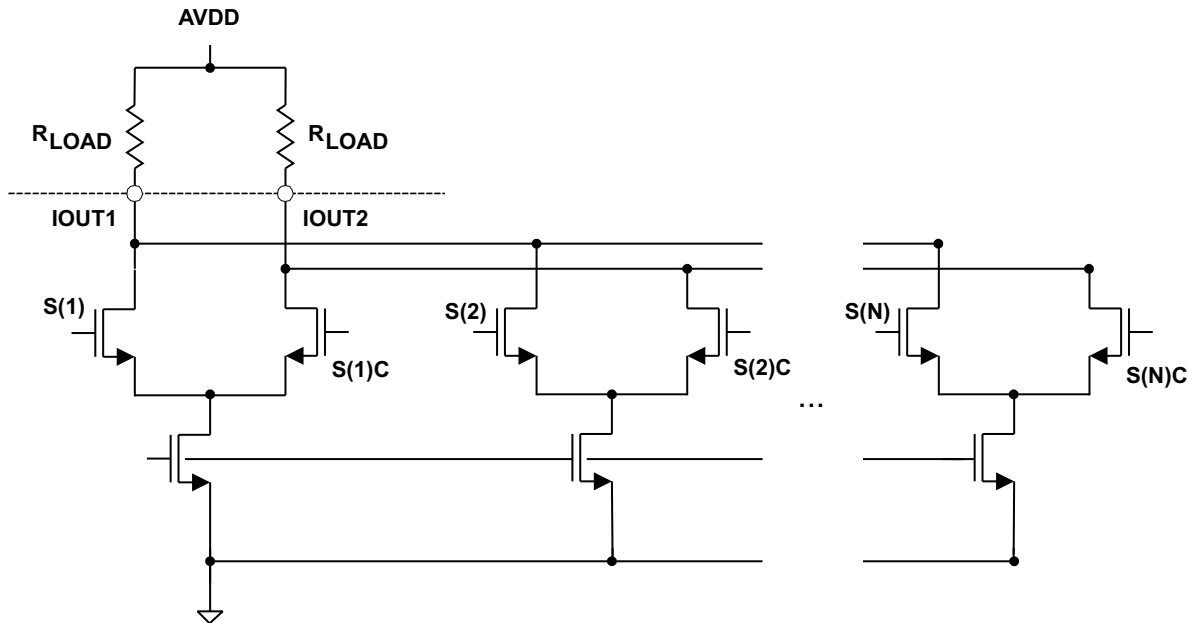

Figure 55. Equivalent Analog Current Output

The DAC3283 can be easily configured to drive a doubly terminated 50Ω cable using a properly selected RF transformer. Figure 56 and Figure 57 show the 50Ω doubly terminated transformer configuration with 1:1 and 4:1 impedance ratio, respectively. Note that the center tap of the primary input of the transformer has to be connected to AVDD to enable a dc current flow. Applying a 20 mA full-scale output current would lead to a 0.5 V_{PP} for a 1:1 transformer, and a 1 V_{PP} output for a 4:1 transformer. The low dc-impedance between IOUT1 or IOUT2 and the transformer center tap sets the center of the ac-signal at AVDD, so the 1 V_{PP} output for the 4:1 transformer results in an output between AVDD + 0.5 V and AVDD – 0.5 V.

Figure 56. Driving a Doubly-Terminated 50-Ω Cable Using a 1:1 Impedance Ratio Transformer

Figure 57. Driving a Doubly-Terminated 50-Ω Cable Using a 4:1 Impedance Ratio Transformer

PASSIVE INTERFACE TO ANALOG QUADRATURE MODULATORS

A common application in communication systems is to interface the DAC to an IQ modulator like the TRF3703 family of modulators from Texas Instruments. The input of the modulator is generally of high impedance and requires a specific common-mode voltage. A simple resistive network can be used to maintain 50Ω load impedance for the DAC3283 and also provide the necessary common-mode voltages for both the DAC and the modulator.

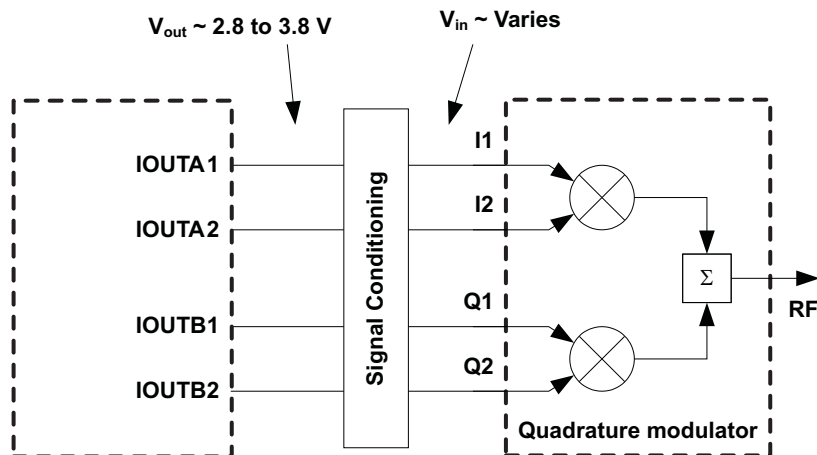

Figure 58. DAC to Analog Quadrature Modulator Interface

The DAC3283 has a maximum 20mA full-scale output and a voltage compliance range of $AVDD \pm 0.5$ V. The TRF3703 IQ modulator family can be operated at three common-mode voltages: 1.5V, 1.7V, and 3.3V.

Figure 59 shows the recommended passive network to interface the DAC3283 to the TRF3703-17 which has a common mode voltage of 1.7V. The network generates the 3.3V common mode required by the DAC output and 1.7V at the modulator input, while still maintaining 50Ω load for the DAC.

Figure 59. DAC3283 to TRF3703-17 Interface

If V1 is set to 5V and V2 is set to -5V, the corresponding resistor values are $R1 = 57\Omega$, $R2 = 80\Omega$, and $R3 = 336\Omega$. The loss developed through R2 is about -1.86 dB. In the case where there is no -5V supply available and V2 is set to 0V, the resistor values are $R1 = 66\Omega$, $R2 = 101\Omega$, and $R3 = 107\Omega$. The loss with these values is -5.76dB.

Figure 60 shows the recommended network for interfacing with the TRF3703-33 which requires a common mode of 3.3V. This is the simplest interface as there is no voltage shift. Because there is no voltage shift there is any loss in the network. With $V1 = 5V$ and $V2 = 0V$, the resistor values are $R1 = 66\Omega$ and $R3 = 208\Omega$.

Figure 60. DAC3283 to TRF3703-33 Interface

In most applications a baseband filter is required between the DAC and the modulator to eliminate the DAC images. This filter can be placed after the common-mode biasing network. For the DAC to modulator network shown in Figure 61, R2 and the filter load R4 need to be considered into the DAC impedance. The filter has to be designed for the source impedance created by the resistor combination of $R3 \parallel (R2 + R1)$. The effective impedance seen by the DAC is affected by the filter termination resistor resulting in $R1 \parallel (R2 + R3 \parallel (R4/2))$.

Figure 61. DAC3283 to Modulator Interface with Filter

Factoring in R4 into the DAC load, a typical interface to the TRF3703-17 with V1 = 5V and V2 = 0V results in the following values: R1 = 72Ω, R2 = 116Ω, R3 = 124Ω and R4 = 150Ω. This implies that the filter needs to be designed for 75Ω input and output impedance (single-ended impedance). The common mode levels for the DAC and modulator are maintained at 3.3V and 1.7V and the DAC load is 50Ω. The added load of the filter termination causes the signal to be attenuated by –10.8 dB.

A filter can be implemented in a similar manner to interface with the TRF3703-33. In this case it is much simpler to balance the loads and common mode voltages due to the absence of R2. An added benefit is that there is no loss in this network. With V1 = 5V and V2 = 0V the network can be designed such that R1 = 115Ω, R3 = 681Ω, and R4 = 200Ω. This results in a filter impedance of R1 // R2=100Ω, and a DAC load of R1 // R3 // (R4/2) which is equal to 50Ω. R4 is a differential resistor and does not affect the common mode level created by R1 and R3. The common-mode voltage is set at 3.3 V for a full-scale current of 20mA.

For more information on how to interface the DAC3283 to an analog quadrature modulator please refer to the application reports *Passive Terminations for Current Output DACs* (SLAA399) and *Design of Differential Filters for High-Speed Signal Chains* (SLWA053).

APPLICATION INFORMATION

DIRECT CONVERSION RADIO

Refer to [Figure 62](#) for an example Direct Conversion Radio. The DAC3283 receives an interleaved complex I/Q baseband input data stream and increases the sample rate through interpolation by a factor of 2 or 4. By performing digital interpolation on the input data, undesired images of the original signal can be pushed out of the band of interest and more easily suppressed with analog filters.

For a Zero IF (ZIF) frequency plan, complex mixing of the baseband signal is not required. Alternatively, for a Complex IF frequency plan the input data can be pre-placed at an IF within the bandwidth limitations of the interpolation filters. In addition, complex mixing is available using the coarse mixer block to up-convert the signal. The output of both DAC channels is used to produce a Hilbert transform pair and can be expressed as:

$$A_{OUT}(t) = A(t)\cos(\omega_c t) - B(t)\sin(\omega_c t) = m(t)$$

$$B_{OUT}(t) = A(t)\sin(\omega_c t) + B(t)\cos(\omega_c t) = m_h(t)$$

where $m(t)$ and $m_h(t)$ connote a Hilbert transform pair and ω_c is the mixer frequency. The complex output is input to an analog quadrature modulator (AQM) such as the Texas Instruments TRF3720 for a single side-band (SSB) up conversion to RF. A passive (resistor only) interface to the AQM with an optional LC filter network is recommended. The TRF3720 includes a VCO/PLL to generate the LO frequency. Upper single-sideband upconversion is achieved at the output of the analog quadrature modulator, whose output is expressed as:

$$RF(t) = A(t)\cos(\omega_c + \omega_{LO})t - B(t)\sin(\omega_c + \omega_{LO})t$$

Flexibility is provided to the user by allowing for the selection of negative mixing frequency to produce a lower-sideband upconversion. Note that the process of complex mixing translates the signal frequency from 0Hz means that the analog quadrature modulator IQ imbalance produces a sideband that falls outside the signal of interest. DC offset error in DAC and AQM signal path may produce LO feed-through at the RF output which may fall in the band of interest. To suppress the LO feed-through, the DAC3283 provides a digital offset correction capability for both DAC-A and DAC-B paths. In addition phase and gain imbalances in the DAC and AQM result in a lower-sideband product. The DAC3283 offers gain and phase correction capabilities to minimize the sideband product.

The complex IF architecture has several advantages over the real IF architecture:

- Uncalibrated side-band suppression ~ 35dBc compared to 0dBc for real IF architecture.
- Direct DAC to AQM interface – no amplifiers required
- DAC 2nd Nyquist zone image is offset f_{DAC} compared with $f_{DAC} - 2 \times IF$ for a real IF architecture, reducing the need for filtering at the DAC output.
- Uncalibrated LO feed through for AQM is ~ 35dBc and calibration can reduce or completely remove the LO feed through.

APPLICATION INFORMATION (continued)

REVISION HISTORY

Changes from Revision A (April 2010) to Revision B	Page
• Changed SDIO description in Terminal Functions Table: SDIO is bidirectional for both 3-pin mode and 4-pin mode.	4
• Changed CONFIG31 default from 0x52 to 0x12	19
• Changed Register CONFIG0 Bit 7 to Reserved, also changed Bit 5 function to Allows the FRAME input to reset the FIFO write pointer when asserted. Changed Bit 4 function first sentence to Allows the FRAME or OSTR signal to reset the FIFO read pointer when asserted.	20
• Changed in Register CONFIG2 Bit 4, Function description from Normal FIFO_ISTR to Normal FRAME	20
• Changed Register CONFIG3 Register Name from CONFIG1 to CONFIG3 and changed first sentence in Bit 4:2	21
• Changed Register CONFIG7 Bit 6 Function and deleted Bit 4 Function	22
• Changed Register CONFIG8 IO Test Function from "word" failed to "byte-wide LVDS bus" failed	22
• Changed Register CONFIG12 to Default = 0x45	22
• Changed Register CONFIG18 Bit 1 Function	24
• Changed Register VERSION31 Default to 0x12	26
• Changed SERIAL INTERFACE section for SDIO operation: first paragraph, "data in only" to "bidirectional"	27
• Changed SERIAL INTERFACE section for SDIO operation: paragraph following Figure 32 , "ALARM_SDO is " to "both ALARM_SDO and SDIO are"	28
• Changed Figure 35	29
• Added Paragraphs to INPUT FIFO SECTION beginning at 4th paragraph after Figure 35	30
• Changed Figure 36	31
• Added config19 - multi_sync_sel to FIFO MODES OF OPERATION section.	31
• Changed Table 4	31
• Added DUAL SYNC SOURCES MODE and SINGLE SYNC SOURCE MODE sections	32
• Added MULTI-DEVICE OPERATION section	32
• Changed DATA PATTERN CHECKER section	34
• Changed Figure 41	36
• Changed DATACLK MONITOR section	37
• Changed –3.75 to +3.75 degrees to –7.125 to +7.125 degrees in QUADRATURE MODULATION CORRECTION (QMC) section	42
• Changed POWER-UP SEQUENCE section	43

PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead/Ball Finish (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
DAC3283IRGZR	ACTIVE	VQFN	RGZ	48	2500	Green (RoHS & no Sb/Br)	CU NIPDAU	Level-3-260C-168 HR	-40 to 85	DAC3283I	Samples
DAC3283IRGZT	ACTIVE	VQFN	RGZ	48	250	Green (RoHS & no Sb/Br)	CU NIPDAU	Level-3-260C-168 HR	-40 to 85	DAC3283I	Samples

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

TBD: The Pb-Free/Green conversion plan has not been defined.

Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

PLASTIC QUAD FLATPACK NO-LEAD

4204101/F 06/11

- NOTES:
- A. All linear dimensions are in millimeters. Dimensioning and tolerancing per ASME Y14.5M-1994.
 - B. This drawing is subject to change without notice.
 - C. Quad Flatpack, No-leads (QFN) package configuration.
 - D. The package thermal pad must be soldered to the board for thermal and mechanical performance.
 - E. See the additional figure in the Product Data Sheet for details regarding the exposed thermal pad features and dimensions.
 - F. Falls within JEDEC MO-220.

RGZ (S-PVQFN-N48)

PLASTIC QUAD FLATPACK NO-LEAD

- NOTES:
- All linear dimensions are in millimeters.
 - This drawing is subject to change without notice.
 - Publication IPC-7351 is recommended for alternate designs.
 - This package is designed to be soldered to a thermal pad on the board. Refer to Application Note, Quad Flat-Pack Packages, Texas Instruments Literature No. SLUA271, and also the Product Data Sheets for specific thermal information, via requirements, and recommended board layout. These documents are available at www.ti.com <<http://www.ti.com>>.
 - Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Refer to IPC 7525 for stencil design considerations.
 - Customers should contact their board fabrication site for recommended solder mask tolerances and via tenting recommendations for vias placed in the thermal pad.

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as "components") are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI's terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers' products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers' products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI's goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or "enhanced plastic" are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have **not** been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.
